

Decision tree and business rules for importing and merging tasks and schedules, as embodied by `-[APCScheduleImporter processTasksAndSchedules]`.

The basic idea:

- we get a bunch of schedules from somewhere
- we divide them into various sets and subsets according to our business rules
- at the end (the bottom arrow from each bubble), we make a choice whether to keep or delete the imported schedules, and terminate, delete, or ignore the active schedules

Because of how Filters work, most of the logic in this diagram happens in about 10 lines of code — one line for each Filter below.

class: APCScheduleImporter
method: -processSchedulesAndTasks

This flowchart was built with OmniGraffle 6.2.5. It's set up so that if you print it at 55%, with 1/2-inch margins, it lays out cleanly on a 2x2 page grid, without any text overlapping a page break.
